

**TDM-PAM Transmitter and Receiver Sciencetech 2152** is a communication system where the message signal is modulated using Pulse Amplitude Modulation and multiple access is provided using Time Division Multiplexing. The message information is encoded in the amplitude of a series of signal pulses and transmitted using Time Division Multiplexing (i.e. in different time slots).

The Trainer demonstrates following modes of operation between transmitter and receiver -

Mode 1: 3 signals communication (Clock /Sync/ Modulated Signals)

Mode 2: 2 signals communication (Sync/Modulated signals); Clock is recovered at receiver.

Mode 3: 1 signal communication (Modulated signal); Clock and Sync are recovered at receiver

### Features

- Crystal controlled clock
- On-board synchronized analog Signal Generator (DC and Sine wave)
- Demonstrates sampling and reconstructed as per Nyquist criterion
